

Assignment

Introduction to Salesforce

Theoretical:

1. What is Salesforce and why is it used?

Salesforce is a CRM (Customer Relationship Management) tool. It is cloud dependent where storing and managing of data is done through internet. Salesforce is used to put all the customer data, sales, support, marketing etc into one place where before it used to be in different parts.

2. What is the difference between SaaS, PaaS, and IaaS?

IaaS (Infrastructure as a Service) provides on-demand access to fundamental IT infrastructure like servers and storage, giving users the most control. Ex. AWS, Azure etc

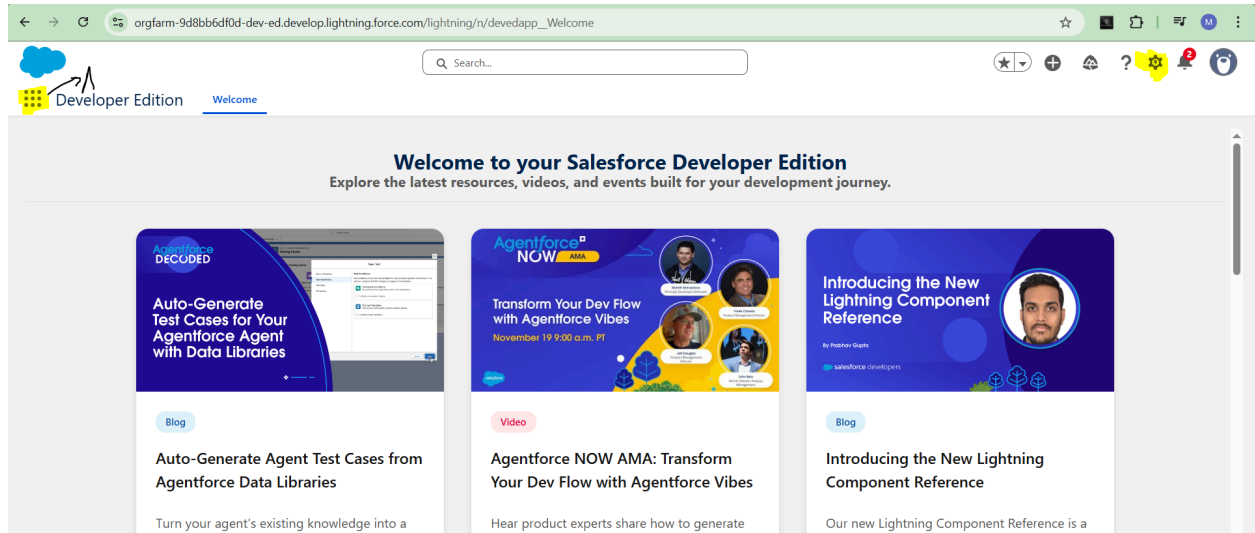

PaaS (Platform as a Service) offers a platform with tools for developers to build, test, and deploy applications, managing the underlying infrastructure for them. Ex. Google App Engine

SaaS (Software as a Service) delivers complete, ready-to-use software applications over the internet, with the provider managing everything from the infrastructure to the application itself. Ex. Salesforce, SAP etc

3. What is a Salesforce Org?

A Salesforce org is a virtual space for a customer that contains all their data, applications, and customizations. It's a self-contained environment, with different types existing for different purposes, such as a live "production" org for daily business operations or various development orgs

1. Login to a Salesforce Developer Org and identify the Home, App Launcher, and Setup

1. What is AppExchange?

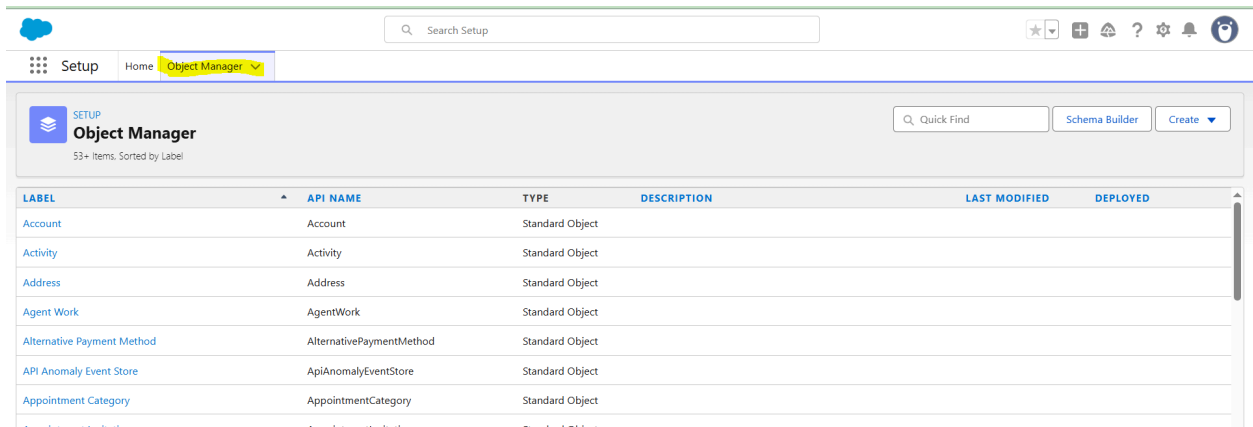

Appexchange ia a place where ready-to-install solutions are there like Apps, Flow Solutions,Components, Consultants etc.

2. What are Managed and Unmanaged packages?

Unmanaged packages are like opensource with full access and no upgrades driven.

Managed packages are like a complete where the user has minimal to no access to modify or upgrade.

Navigate to Object Manager:

The screenshot shows the Salesforce Setup interface with the 'Object Manager' tab selected. The page displays a list of standard objects with columns for Label, API Name, Type, Description, Last Modified, and Deployed. The objects listed include Account, Activity, Address, Agent Work, Alternative Payment Method, API Anomaly Event Store, and Appointment Category.

Label	API Name	Type	Description	Last Modified	Deployed
Account	Account	Standard Object			
Activity	Activity	Standard Object			
Address	Address	Standard Object			
Agent Work	AgentWork	Standard Object			
Alternative Payment Method	AlternativePaymentMethod	Standard Object			
API Anomaly Event Store	ApiAnomalyEventStore	Standard Object			
Appointment Category	AppointmentCategory	Standard Object			

1.What is a custom object?

A custom Object is like a database table created by user same like excel.

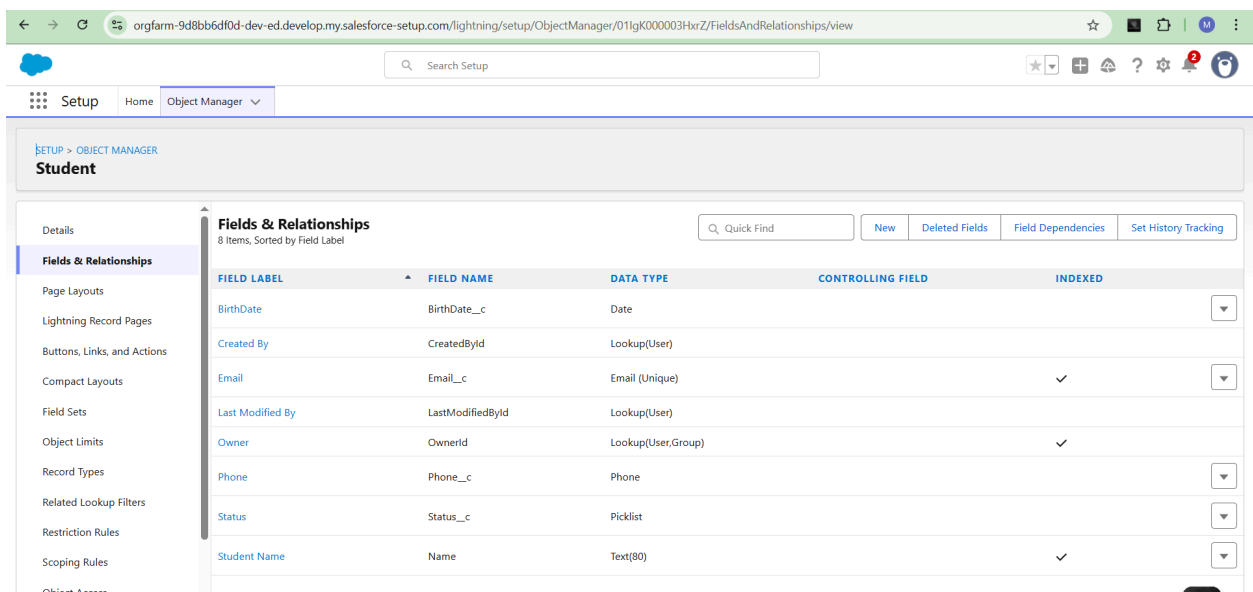

2. What is a field type? Name 5 field types.

Field type is similar to column in an excel file, which holds data related to object to track and report on. Five field types are:

Address, picklist, phone, email, number, currency

1. Create a custom object named “Student__c”.

2. Add fields: Email, Phone, Date of Birth, and Status (Picklist).

The screenshot shows the Salesforce Setup interface for a custom object named 'Student'. The 'Fields & Relationships' section is active, displaying a list of fields with columns for Field Label, Field Name, Data Type, Controlling Field, and Indexed. The fields listed include BirthDate, Created By, Email, Last Modified By, Owner, Phone, Status, and Student Name.

Field Label	Field Name	Data Type	Controlling Field	Indexed
BirthDate	BirthDate__c	Date		
Created By	CreatedById	Lookup(User)		
Email	Email__c	Email (Unique)		✓
Last Modified By	LastModifiedById	Lookup(User)		
Owner	OwnerId	Lookup(User,Group)		✓
Phone	Phone__c	Phone		
Status	Status__c	Picklist		
Student Name	Name	Text(80)		✓

1. What is a Lookup Relationship?

A lookup relationship is a type of connection between two objects that links them without being a strict dependency. It allows one object to reference a record in another object, similar to how a "Contact" record can be linked to an "Account" record. This relationship is loosely coupled, meaning if the parent object is deleted, the child object records can still remain.

2. What is a Master-Detail Relationship?

A master-detail relationship is a one-to-many, parent-child connection between two database tables or objects where the child (detail) is entirely dependent on the parent (master). This tight coupling means the child record cannot exist without a parent, and it inherits security and sharing settings from the master. When the master record is deleted, the child records are automatically deleted as well.

3. Which one supports Roll-Up Summary Fields?

Roll-Up Summary fields are only available for the parent object in a master-detail relationship. This type of relationship creates a strong link between the two objects, ensuring data integrity and allowing the parent to control aspects of the child records.

1. Create a Lookup field on Student__c to Contact.

A system-generated sequence number that uses a display format you define. The number is automatically incremented for each new record.

A read-only field that derives its value from a formula expression you define. The formula field is updated when any of the source fields change.

A read-only field that displays the sum, minimum, or maximum value of a field in a related list or the record count of all records listed in a related list.

Creates a relationship that links this object to another object. The relationship field allows users to click on a lookup icon to select a value from a popup list. The other object is the source of the values in the list.

Creates a special type of parent-child relationship between this object (the child, or "detail") and another object (the parent, or "master") where:

- The relationship field is required on all detail records.
- The ownership and sharing of a detail record are determined by the master record.
- When a user deletes the master record, all detail records are deleted.
- You can create rollup summary fields on the master record to summarize the detail records.

The relationship field allows users to click on a lookup icon to select a value from a popup list. The master object is the source of the values in the list.

Creates a relationship that links this object to an external object whose data is stored outside the Salesforce org.

Allows users to select a True (checked) or False (unchecked) value.

Allows users to enter a dollar or other currency amount and automatically formats the field as a currency amount. This can be useful if you export data to Excel or another spreadsheet.

Allows users to enter a date or pick a date from a popup calendar.

Allows users to enter a date and time, or pick a date from a popup calendar. When users click a date in the pop-up, that date and the current time are entered into the Date/Time field.

Allows users to enter an email address, which is validated to ensure proper format. If this field is specified for a contact or lead, users can choose the address when clicking Send an Email. Note that custom email addresses cannot be used for mass emails.

Allows users to define locations. Includes latitude and longitude components, and can be used to calculate distance.

Allows users to enter any number. Leading zeros are removed.

Allows users to enter a percentage number, for example, "10" and automatically adds the percent sign to the number.

Many to Many Relationship:

1. What is a Many to Many relationship?

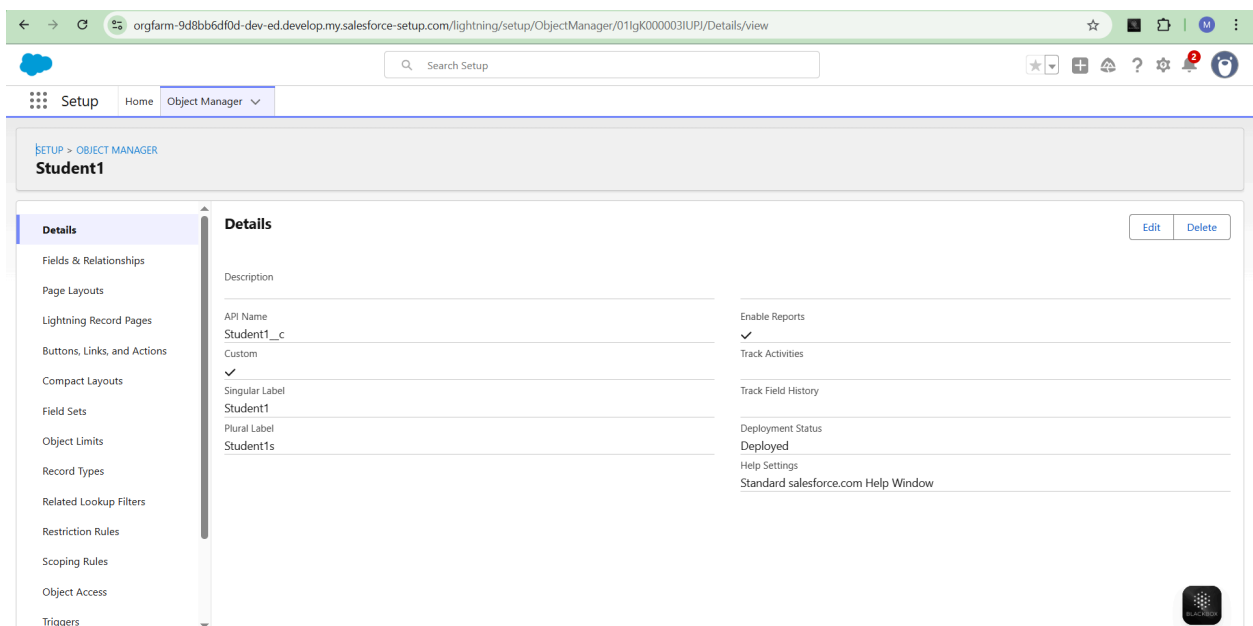

A many-to-many relationship in Salesforce is when multiple records from one object can be linked to multiple records from another object, and vice versa, like multiple students and multiple courses. This relationship is implemented using a junction object, which is a custom object that acts as

a bridge between the two original objects, typically via two master-detail or lookup relationships.

2. What is the role of a Junction Object?

A junction object acts as a bridge between two other objects to create a many-to-many relationship, where each record in one object can be associated with multiple records in the other, and vice versa. This is achieved by creating a custom object that contains two master-detail relationships, one for each of the parent objects. A common example is an "Application" object linking a "Candidate" object to a "Position" object, allowing one candidate to apply for many positions and one position to have many applicants

1. Create a Junction Object and link two master detail fields.

1. What is a Roll-Up Summary field?

A roll-up summary field aggregates data from a set of related child records and displays the result on a parent (master) record. It is a read-only field that automatically updates as child records are added, modified, or deleted. These fields can perform calculations like COUNT, SUM, MIN, or MAX on the child records and are created on the master object of a Master-Detail relationship.

2. When does a validation rule trigger?

Validation rules verify that the data entered by a user meets certain criteria before the user can save the record.

User input data: Where users may be prone to making mistakes or cutting corners, or when you need data to be in a certain format. Ex. Age must be greater than 18.etc

System modified records: Changes to data triggered by imports, automated processes, integrated systems, etc. will need to abide by validation rules

1. Create a Roll-Up Summary field to count related child records.

The screenshot shows the Salesforce Setup interface for the 'Student1' object. The 'Fields & Relationships' section is active, displaying a list of 7 fields. The fields are sorted by label. The table below summarizes the fields shown in the screenshot.

1. What is a List View?

A Salesforce list view is a customized, filtered list of records for a specific object, like accounts or opportunities, allowing users to efficiently view, sort, and edit their data. You can create custom views with specific filters, share them with others, and use different display formats like table, Kanban, or split view. Users can also quickly search, sort by multiple columns, and even perform inline editing directly from the list.

2. What is the use of a Quick Action?

An object-specific Quick Action performs a specific action in Salesforce, such as creating or updating a record. Quick Actions can help streamline your users experience.

1. Create a List View filtering active students.
